1. React JS with any local SQL database.
2. User may add sub-account contained with different variables
   a. Last Name
   b. First Name
   c. Age
   d. Language
   e. Progress of "Activity One" and "Activity Two"
      i. Scroll Down Selection. Read the "Progress" from the database. Default as the first one.
      ii. Ex: There are 3 files named
         1. "Activities 1.1""Activities 1.2""Activities 2.1".
         2. Then the scroll-down selection has only those 3 as the choices.
         3. When the admin adds a "Activities 3.1", then a "Activities "3.1" selection will appear.
3. A page shows the details of the above variables of each subaccount. With a downloadable file linked to progress and stored in the database.
